

Classes

What is Class?

Class

A user defined prototype for an object that defines a set of attributes that characterize any object of the class. The attributes are data members and methods.

Instance

A user defined prototype for an object that defines a set of attributes that characterize any object of the class. The attributes are data members and methods.

Syntax

```
class class_name:  
    statement1  
    statement2  
    statement3  
    statement4  
    etc.
```

Class: Student
Attributes: Name and Rollno
Methods: setName() and setRollno()

Why Classes are useful?

Multiple instances

- Classes are essentially factories for generating one or more objects. Every time we call a class, we generate a new object.

Customization via Inheritance

- We can extend a class by redefining its attributes outside the class in new components coded as subclasses.

Operator overloading

- Operator overloading allows same operator to have different meaning according to the context.

Hands-On

Class Attributes

1

Data member

A class variable or instance variable that holds data associated with a class and its objects.

Class variable

A variable that is shared by all instances of a class.

Instance Variable

Defined inside a method and belongs only to the current instance of a class.

2

Method

A special kind of function that is defined in a class definition.

```
class class_name:
    data=42          #class variable
    def getdata(self): #method
        data = 40    #instance variable
# 'self' references the instance object being
processed
```

Example

Define a
class

```
>>>class First:  
    def setdata(self ,  
        value):  
        self.data = value  
    def getdata(self):  
        print self.data
```

Creating
instances of
class

```
>>>x = First()  
>>>y = First()
```

Example

Calling methods

```
>>>x.setdata('hello')
>>>y.setdata(21)
>>>x.getdata()
    hello
>>>y.getdata()
    21
```

Setting attribute outside class

```
>>>x.data = 'hi!'
>>>x.getdata()
hi!
>>>x.anothername = 'it is
                    possible'
>>>x.anothername
'it is possible'
```

Hands-On
